

2. Dynamic Form Fields Based on Ticket Type (`ticket.js`)

Description:

This script makes the ticket form responsive to user choices. When the user selects a ticket type (`Computer`, `Software`, or `Network`) from a dropdown list, the script shows the appropriate set of fields while hiding the others.

Key DOM Actions:

- Uses an event listener for `change` on the `<select>` element
- Shows and hides `<div>` sections dynamically with `style.display`
